

let us know about your self ?

Growing up in small village.

I never daydreamed in my mind to be interested in computer science.

When I was a child I like playing football, watching movies, playing games, reading books and more always I interested in creating and designing small cars, such as three wheeled vehicles and motorcycle. Since in small village cars are essential/most valued means of transportation. But my village has lack of extensive public transportation. And also in my community I used to work as a television set up technical like by setting up satellite dishes, and updating software of TV recover. This makes me to be interacted with advancing technology. But unfortunately I faced difficult challenges like lack of internet, information technology, and other important materials like Computer, smart phone and etc. Although, growing up in small village is a reward for me because I developed strong, I get strong personal relationship with my clients and through whom I developed sociability. Generally, one of my greatest passion is discovering new innovation and also to turn my dream in to reality

. My proudest achievement to date is learning technology (esp. Computer science) related things on my own without attending any official schooling in a rural community with inadequate technology. This gives me strength, but it also makes me a little bit louder when I live in a technologically advanced city. I'm was moved one step forward when i apply for this computer science program in particular, Addis Coder spark One of the reasons I'm interested in it. , And as it's content I will learn more about Python and algorithms if I take part in this program, and I will also get to work with motivated students so learn from them and share experiences with them, and learn from mentors with years of expertise. I'll put in the effort to develop and achieve my long-term computer science goal.

The primary reason that I was passionate to join Addis Coder is that it concentrates on providing access to students, and since I find it it offer a chance to overcome those obstacles I saw. I hope with the skill I will get from different programs like AC to develop different applications that give education access to students in villages where schools and teachers are scarce ("the possibility is eandless" and to make them not to be affected by the same obstacles I have experienced previously. Particularly, this program focuses on problem-solving skills and algorithm thinking. This is why I am interested in this program. Thank you so much.
